

A Resolution to Redirect NASA Funding

Whereas: A significant percentage of NASA's \$18.96 billion funding is being wasted on esoteric space exploration projects that do not have near term benefits for the people of the United States or the world, and

Whereas: By redirecting all the wasted NASA funding towards the research and production of sustainable green energy, NASA will make more useful discoveries that are more relevant to the United States current economic and political problems, and

Whereas: The United States' economic strength derives from its innovations in Science and Technology some of which are spawned by NASA-funded projects, and

Whereas: Alternate energy innovations would be more beneficial to creating useful industries in the United States, and

Whereas: The United States needs to become more independent from foreign oil and green energy will help the United States move towards independence from foreign-sourced fossil fuels, and

Whereas: Advances in green energy sciences will benefit the United States both economically and politically and will help reduce the United States' effect on global climate change, and

Therefore: Be it resolved by this student congress that a significant portion of NASA funding will be redirected towards the research and production of sustainable green energy sciences.
